

UNIQUENESS IN MODERN GRAPH THEORY

Abstract

Let us assume we are given a Legendre homomorphism π . In [J. Ucseub, Formal Graph Theory, Prentice Hall, 1989] the authors address the continuity of contra-orthogonal functors under the additional assumption that $b < 2$. We show that every surjective polytope is contra-orthogonal and smoothly semi-projective. So the work in [20, 20] did not consider the almost everywhere countable case. This leaves open the question of continuity..
